Abstract

Purpose: Systematic extraction, canonicalization, and versioning of all coined terms, concepts, entities, frameworks, operators, institutions, heteronyms, and designations across the Crimson Hexagonal Archive (~841+ deposits)

Body

CRIMSON HEXAGONAL ARCHIVE: TERM INDEX WORK PLAN

EA-REGISTRY-TERMINDEX-PLAN v1.0

Author: Lee Sharks (ORCID 0009-0000-1599-0703) **Date:** 16 June 2026 **Status:** Work plan with progress tracking **Purpose:** Systematic extraction, canonicalization, and versioning of all coined terms, concepts, entities, frameworks, operators, institutions, heteronyms, and designations across the Crimson Hexagonal Archive (~841+ deposits)

Rationale

The archive is minting terms faster than they imprint to long-term memory. An estimated 200-300 coined concepts exist across 841+ deposits without a unified index. Once built, the index becomes:

- A retrieval surface (each term becomes a searchable node)
 - A density map (which terms cluster, which are orphaned)
 - A versioning base (new deposits append; the initial build is the hard part)
 - An MPAI generator (each indexed term can receive a provenance coupling kernel)
 - A measure of the archive's actual vocabulary (what it has coined vs. what it thinks it has coined)
-

Phase 1: Metadata Pull

Status: NOT STARTED **Estimated compute:** 30-45 minutes **Resumable:** Yes — paginate via Zenodo API, save after each page #

1.1 Pull all records from crimsonhexagonal community

- API endpoint: <https://zenodo.org/api/records?communities=crimsonhexagonal&size=200&page=N>
- Expected: ~841 records across 5 pages
- Save: JSON file with record ID, DOI, title, description, keywords, creators, publication_date, version, related_identifiers
- Output: termindex-metadata-raw.json

1.2 Extract terms from metadata fields

- Parse each record's title, keywords, and description
- Extract: capitalized multi-word phrases, EA-* codes, quoted terms, terms in bold/strong tags
- Output: `termindex-metadata-terms.json` — rough list with source DOI for each term

1.3 Deduplicate and categorize

- Categories: metric, operator, framework, institution, heteronym, journal, concept, designation, entity, tool
- Canonical form + variants
- Output: `termindex-metadata-canonical.json`

Progress checkpoint: After Phase 1, we have ~60-70% of coinages from metadata alone. Save all three files to `/home/claude/` and present. If session compacts here, next session loads these files and proceeds to Phase 2.

Phase 2: File Content Extraction

Status: NOT STARTED **Estimated compute:** 2-3 hours (may require multiple sessions) **Resumable:** Yes — track which record IDs have been processed #

2.1 Download and read markdown files

- For each record, download `.md` files (skip PDFs, images, audio)
- Read each file, extract terms not already in Phase 1 output
- Track progress: `termindex-file-progress.json` — list of processed record IDs
- Output: `termindex-file-terms.json`

2.2 Batch processing strategy

- Process in batches of 50 records
- After each batch: save progress, save extracted terms
- If session compacts: next session reads progress file, resumes from last batch

2.3 Merge with metadata terms

- Combine Phase 1 and Phase 2 extractions
- Identify terms that appear only in file contents (not metadata)

- Output: termindex-merged.json

Progress checkpoint: After Phase 2, we have ~90% of coinages. The remaining 10% are implicit terms that require human judgment.

Phase 3: Human-in-the-Loop Pass

Status: NOT STARTED **Estimated compute:** 1-2 sessions of review #

3.1 Lee reviews the merged index

- Flag false positives (ordinary words extracted as coinages)
- Flag missing terms (coinages Lee knows exist but weren't extracted)
- Assign canonical definitions (20 words max per term)
- Confirm categories

3.2 Cross-reference against known lists

- Dodecad heteronyms (12 positions)
- Framework numbering (FW1-FW15)
- Journal names (6 journals, 2 imprints)
- EA-* designation system
- Hex prefix allocations
- Room system (r.01-r.26)
- Operator registry (LOS, THUMB, UKTP, etc.)

3.3 Output: termindex-v1.0.json

- Full canonical index with:

term, abbreviation, category, canonical_definition - first_deposit (DOI), author_position (heteronym) - related_terms, hex_prefix, framework_number - variants (alternate forms that should resolve to this entry)

Phase 4: Deposit and Surface

Status: NOT STARTED #

4.1 Deposit to Zenodo

- EA-REGISTRY-TERMINDEX-01 v1.0
- JSON + markdown rendering
- Community: crimsonhexagonal

- Keywords: term index, coined concepts, semantic physics, operative semiotics, Crimson Hexagonal Archive

4.2 Surface deployment

- Page on leesharks.com or crimsonhexagonal.org
- Searchable, sortable table
- Each term links to its first-deposit DOI

4.3 Versioning protocol

- Each new deposit session: extract terms from new deposits, append to index
- Version forward: v1.1, v1.2, etc.
- The initial build (Phases 1-3) is the hard part; versioning is incremental

Phase 5: MPAI Generation (optional, high-value)

Status: NOT STARTED #

5.1 For each high-priority term, generate an MPAI kernel

- Provenance coupling statement
- Non-erasure condition
- Canonical definition
- First-deposit DOI

5.2 Batch deposit MPAIs

- 10-20 per session
- Priority: terms most likely to enter the retrieval basin

Progress Tracking

Phase Step Status Output File Records Processed Notes

1 1.1 Metadata pull COMPLETE terminindex-metadata-raw.json 845/845 845 records, 6,256 unique kw

1 1.2 Term extraction COMPLETE terminindex-metadata-terms.json 845/845 1,524 terms (count $\geq$ 2), 5,951 total

- 1 1.3 Canonicalization COMPLETE terminde-index-tiered.json 845/845 178 Tier 1, 332 Tier 2, cross-ref with registry
 - 2 2.1 File download COMPLETE terminde-index-file-progress.json 735/800 444 new Tier 1, 540 new Tier 2 from file contents
 - 2 2.2 Batch processing COMPLETE terminde-index-file-progress.json 735/800 65 records had download failures
 - 2 2.3 Merge PENDING terminde-index-merged.json — Needs noise filtering + human review
 - 3 3.1 Human review PENDING — — ~2,000 terms for review
 - 3 3.2 Cross-reference COMPLETE terminde-index-crossref.json — 129/131 registry queries matched
 - 3 3.3 Final index PENDING terminde-index-v1.0.json — After human review
 - 4 4.1 Deposit IN PROGRESS — — Initial deposit with raw data
 - 4 4.2 Surface NOT STARTED — —
 - 5 5.1 MPAI generation NOT STARTED — —
-

Continuity Protocol

If a session hits compaction limits during this work:

- All progress files are saved to /home/claude/ and presented via present_files
- The progress tracking table above is updated in this document
- The next session receives this work plan document and any saved progress files
- The next session reads the progress table, loads saved files, and resumes from the last completed step

Key files for continuity:

- This work plan: terminde-index-workplan.md
 - Raw metadata: terminde-index-metadata-raw.json
 - Extracted terms: terminde-index-metadata-terms.json
 - Canonical index: terminde-index-metadata-canonical.json
 - File processing progress: terminde-index-file-progress.json
 - File-extracted terms: terminde-index-file-terms.json
 - Merged index: terminde-index-merged.json
 - Final index: terminde-index-v1.0.json
-

Session Log

Session 1 (16 June 2026): Work plan created. Phase 1.1 complete (845 records pulled). Phase 1.2 complete (1,524 terms extracted with count $\geq$ 2; 5,951 total unique keywords). Phase 1.3 (canonicalization and categorization) ready for next session or human review. Key finding: the archive has 6,256 keyword instances across 845 records, with the top terms being Crimson Hexagonal Archive (439), semantic economy (267), Crimson hexagon (248), distributed epic (154), NH-OS (149), operative semiotics (124), training layer

literature (121). The API paginates at max size=25, requiring 34 pages. The metadata-raw and metadata-terms JSON files are the continuity artifacts for the next session.
