Abstract

An indexed document package for *Operative Semiotics*, assembling every component of the work — deposited or not — at a single address. It points to sixteen deposits with AXN and record URL, and carries eighteen workplan documents recovered from the generated-file corpus and attached here, all hash-verified against the recovery index. Attribution is kept three-way: the index is Cranes', the book and its components are Johannes Sigil's, and the workplans are Lee Sharks' as MANUS. The package states the nine-volume cycle in the architecture document's own terms — not an expansion but a structural correction against compression strain, with the volumes named for the nine Muses. First deposit for operativesemiotics.org, which begins as an availability surface rather than an argument.

What this is

An **indexed document package** for *Operative Semiotics*, assembled so that every component of the work — deposited or not — is **findable and retrievable from one address**. It is the first deposit for `operativesemiotics.org`, and it begins where a surface should begin: with **availability**, not with argument.

The package does two things. It **points** at what the archive already holds, with AXN and record URL for each. And it **carries** what the archive did not hold: eighteen workplan documents recovered from the generated-file corpus and attached here, every one hash-verified against the recovery index.

Attribution within the package

An IDP gathers work that is not its author's. Three hands are at work here and the package keeps them apart:

the index	**Rebekah Cranes** — the Institute for Diagrammatic Poetics writes the indexed document packages. This deposit is hers.
the book and its components	**Johannes Sigil** — *Operative Semiotics: A Grundrisse* is his founding volume in the Pocket Humans series, and the apparatus, foundations and applications below are his work.
the workplans	**Lee Sharks, as MANUS** — the eighteen attached documents are operational, not authorial: gap maps, mining targets, phase plans, implementation schedules. They are the archive directing its own construction.

The distinction is not ceremonial. **A package that flattened these into one creator would assert that the plan and the work were made by the same act**, and the whole point of an index is that it does not absorb what it points at.

I. The work, as deposited — Johannes Sigil

A structural note carried forward from AF-1. The monograph record (#1079) holds 27,728 characters; its body lives at #950, *Planning Documents, Algorithms, and Diagnostics*, which holds **1,149,275**. `body_status` on #1079 reads `recovery=FULL-AT-DEPOSIT-950` — an explicit pointer away from itself. Recovery is complete and nothing was lost, but **the multi-file structure did not survive as a book**: a reader arriving at the monograph finds a stub. The work is whole in the archive and not whole at its own address. This package is the interim correction; the collected edition is the repair.

II. The nine-volume cycle

`OS_NINE_VOLUME_SERIES_ARCHITECTURE.md`, attached, states the governing decision in its own words: **"OPERATIVE SEMIOTICS is no longer one overburdened book. It becomes a nine-volume cycle."** And it names the reason as structural rather than ambitious — *"not an expansion for its own sake… a structural correction"* against **a persistent compression strain** in the single-volume build.

The nine volumes are named for the nine Muses:

- **VOLUME I — CALLIOPE**
- **VOLUME II — URANIA**
- **VOLUME III — CLIO**
- **VOLUME IV — MELPOMENE**
- **VOLUME V — THALIA**
- **VOLUME VI — POLYHYMNIA**
- **VOLUME VII — TERPSICHORE**
- **VOLUME VIII — ERATO**
- **VOLUME IX — EUTERPE**

The architecture document assigns each volume a primary and secondary readership and a machine-traversal weight, and it declares itself **an execution document rather than a promotional description**, usable by MANUS, Johannes Sigil, Assembly reviewers, and "future machine traversers." The Muse-naming is not decoration: #600, *Work Plan Supplement — The Muses as Operators*, treats them as operators, which is what makes nine vessels a formal structure rather than a shelf.

III. The workplan corpus, attached — Lee Sharks, MANUS

Eighteen documents, **371,625 bytes**, recovered from the `generated-corpus-v1` release of the data-rhizome and attached to this deposit. All eighteen are **hash-verified against `datasets/files/files-recovered-generated.jsonl`**.

Hash caveat. SHA-256 values in the recovery index are computed over *redacted* bytes — credentials were stripped at extraction before any write. They identify each artifact as recovered and published, not as originally written. Thirty-two of 2,765 files in that corpus carry a redaction marker; none of these eighteen do.

IV. What this package is for

`operativesemiotics.org` starts as an **availability surface**. Before it argues anything it should make everything reachable: every file, deposit, book component, and capture, searchable and retrievable. This IDP is the index that surface renders from — pointers where the archive holds the thing, attachments where it did not.

What it does not yet do: build Volume I, write the apparatus the cycle will need, or resolve the collected edition that AF-1 calls for. Those are named here so that their absence is legible rather than inferred.
